BAYES NETS: ASSUMPTIONS

Given the graph, assumptions we are required to make in order to define the Bayes net:

$$P(x_i|x_1,\ldots,x_{i-1}) = P(x_i|parents(x_i))$$

BAYES NETS: ASSUMPTIONS

Given the graph, assumptions we are required to make in order to define the Bayes net:

$$P(x_i|x_1, \ldots, x_{i-1}) = P(x_i|parents(x_i))$$

Beyond above "chain rule $\longrightarrow$ Bayes net" conditional independence assumptions

- Often additional conditional independences
- They can be read off the graph

- Causal chain $A \to B \to C$ where B is unobserved (either direction)
- Common cause $A \leftarrow B \to C$ where B is unobserved
- Common effect (aka v-structure): $A \to B \leftarrow C$ where B or *one of its descendents* is observed

BAYES NETS REPRESENTATION SUMMARY

Bayes nets compactly encode joint distributions

Guaranteed independencies of distributions can be deduced from BN graph structure

D-separation gives precise conditional independence guarantees from graph alone

A Bayes net joint distribution may have further (conditional) independence that is not detectable until you inspect its specific distribution
