

CS5281 Internet Application Development: Tutorial on JavaScript

In this tutorial, we will extend *Reg.html* which was created in earlier tutorial.

Using JavaScript, it is possible to verify the content of form before submission.
To do so, one can make use of the *onsubmit* event:

`<form name="Reg" action="..." onsubmit="return My_JavaScript_Function();">`

Once the user clicked the submit button, the function indicated by **onsubmit** will be executed
The function invoked by **onsubmit** should return a Boolean value.
Value **true** represent the validation is OK and submission is allowed, while **false** stops the form from submitting.

1. Write a simple verification routine which stops submission if the name field, email field or the description field (*Des*) is empty.

Hints:

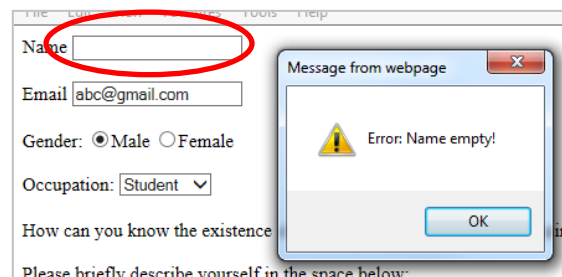

You may compare the content with Empty String ""

e.g. *if (Reg.name.value == "")*

Alternatively, you can use the *.length* property of the related control instead:

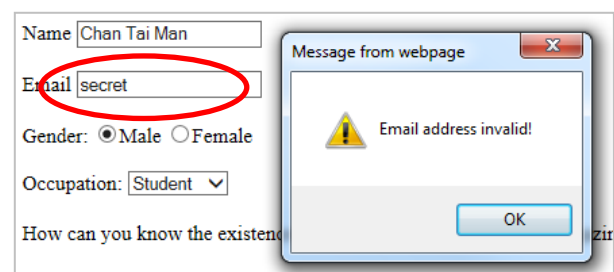

e.g. *if (Reg.name.value.length==0)*

If error is detected, the page should inform the user using the *alert()* function and stop the form submission..

2. In gender, user should select either Male or Female.
How can you prevent users from choosing none of them?

3. Let's define "valid email address" as a string containing a single "@" character. The "@" symbol cannot be placed at the first or last position of the string. Modify your code in 1) to detect valid email address.

There exist different approaches to solve this problem. For instance:

You may write a loop to check the characters one by one, using *charAt()* method, or

You may call *indexOf()* and *lastIndexOf()* to check the position of the first & last '@' character.

Submission

- Due date: On or before 27-Mar (Week 10 Friday) 11:59pm.
- Students will upload their work to Canvas.
